Art Unit: 1773

DETAILED ACTION

Continued Prosecution Application

1. The request filed on 10-26-99 for a Continued Prosecution Application (CPA) under 37 CFR

1.53(d) based on parent Application No. 08/690,136 is acceptable and a CPA has been established.

The applicant has canceled the method claims, only the article claims remain. An action on the CPA

follows.

Claim Rejections - 35 USC § 112

2. The following is a quotation of the second paragraph of 35 U.S.C. 112:

> The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention.

3. Claims 22 and 27 are rejected under 35 U.S.C. 112, second paragraph, as being indefinite for

failing to particularly point out and distinctly claim the subject matter which applicant regards as the

invention. These claims have the recitation "homopolymers and copolymers of polyethylene and

polypropylene, and combinations thereof" This recitation is confusing for the following reasons: It

is not clear if the applicants mean only ethylene-propylene copolymers or copolymers of each of these

individual materials. It is also not clear if combination relates to monomers present or blends of

polymers.

Claim Rejections - 35 USC § 102

4. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless --

- (b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.
- (e) the invention was described in a patent granted on an application for patent by another filed in the United States before the invention thereof by the applicant for patent, or on an international application by another who has fulfilled the requirements of paragraphs (1), (2), and (4) of section 371(c) of this title before the invention thereof by the applicant for patent.
- 5. Claims 19, 20, 21, 22, and 25 are rejected under 35 U.S.C. 102(b) as being anticipated by Sheth (4,929,303).

Sheth teaches embossed films which have been laminated to a non-woven fabric (column 6, lines 39+), in which the films comprise a 50/50 blend of LDPE and calcium carbonate (table II), said films have large WVTR which are well above the applicants' claimed minimum value.

6. Claims 19-23, 26-28 are rejected under 35 U.S.C. 102(b) as being anticipated by Sheth et al. (5,055,338).

Sheth et al. teach embossed films which are then metallized. These films are produced from a blend of polyethylene material and inorganic filler (50/50 blend of LLDPE and calcium carbonate)

Application/Control Number: 08/690,136

Art Unit: 1773

and polyisobutylene, example 1). The films also can comprise elastomers to improve the strength and

softness of the resulting films (column 5, lines 13+).

The films are formed by a tubular extrusion process which results in the formation of a tubular

film which is blown, and then stretched on rollers using conventional techniques. The tubular film

is embossed after it has been formed (columns 5 and 6), especially column 6, lines 8+.

A collapsed tubular film as shown by Sheth et al. would correspond to the claimed two layer

structure. These films have high WVTR relates in both the metallized and un-metallized forms as

shown by example 1. While the example is produced by cast extrusion, Sheth et al. teach how to

produce blown films with very clear specificity and thus the claimed two layer structure is anticipated.

The teachings of a reference is not limited solely to the working examples: the teachings of the

reference as a whole and the ordinary skill of the art must be taken into consideration.

7. Claims 19, 20, 21, 22, and 25 are rejected under 35 U.S.C. 102(e) as being anticipated by Wu

et al. (5,865,926).

Wu et al. teach films which have been embossed by grooved rollers (figures 1 and 2). The

films are porous as shown by examples 1, and have the claimed WVTR, and olefin / filler

compositions which ave been laminated to a non-woven fibrous web.

Regarding claims 21 and 28 these are process limitations, and the examiner takes the position

that these are met by the mere fact that the prior art articles are embossed.

Claim Rejections - 35 USC § 103

- 8. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
 - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 9. Claims 19, 20, 21, 23, 24, and 25 are rejected under 35 U.S.C. 103(a) as being unpatentable over JP 1266150 (of record) in view of Schwarz (4,289,832) and Sheth et al. (5,055,338).

JP 1266150 teach filled porous films which comprise a blends of 100 parts of blend of a crystalline polymers such as 20-80% polyethylene and 80-20% of an elastomer such as SBR, styrene butadiene rubber, and 50-200 parts by weight of an inorganic filler. These films are stretched and used as the moisture proof sheet for paper diapers. The applicants are using their films in the same types of environment. The applicants also use their materials in the formation of diapers, and thus these are analogous laminate structures. The also examiner takes official notice that disposable diapers conventionally have layers of fibers.

The essential difference between the structure taught by JP 1266150 and that claimed is the specific WVTR and the embossing of the film structure.

Schwarz teaches that filled films can be embossed using grooved rollers in order to make them porous (column 2, lines 46+).

Application/Control Number: 08/690,136

Art Unit: 1773

Seth et al. teach the concept of how the amount of filler and degree of stretching is related

to the porosity of the resulting film (column 4, lines 42-61).

It would have been obvious to one having ordinary skill in the art at the time the invention was

made to have embossed the films taught by JP 1266150 using the embossing technique taught by

Schwarz in order to produce a porous structure.

Regarding the specific WVTR, it would have been obvious to one having ordinary skill in the

art at the time the invention was made to have varied the amount of filler and the stretching

conditions in order to produce a film having a desired permeability, since the amount of filler and

degree of stretching would both be related to the amount of porosity, since each filler particle acts

as a nucleus for the formation of a pore and the degree of stretching is related to the size of said pore.

Response to Arguments

10. Applicant's arguments with respect to claims 19-28 have been considered but are moot in

view of the new ground(s) of rejection.

Conclusion

Any inquiry concerning this communication or earlier communications from the examiner

should be directed to D. Lawrence Tarazano whose telephone number is (703) 308-2379. The

examiner can normally be reached on M-F from 8:30 am to 5:30 pm.
